

## ABSTRACT OF THE DISCLOSURE

A computerized system for coding finite numbers of words and symbols in a source language with an indexed database of unique meanings associated with words and symbols in a plurality of other languages. The positioning of the coded words respond to a finite number of grammatical structures in each of the languages characterized by the sequences of the classes of the words or symbols. A user at the source language end has control over the translation method and is allowed or required to eliminate the communication from ambiguities.
